

WEEKLY NEW BRUNSWICK INFLUENZA REPORT

Reporting period: March 15 to March 21 2020 (week 12)

Summary

In New Brunswick, influenza activity continued to decrease in week 12

New Brunswick:

- There have been 108 positive influenza cases in week 12. Since the beginning of the new season, 2324 cases has been reported, 69 influenza A (H1N1)pdm09, 30 influenza A (H3), 846 influenza A (unsubtyped), 1366 influenza B and 13 had both influenza A and B simultaneously.
- There have been 7 new influenza associated hospitalizations during week 12. So far this season, 264 influenza associated hospitalizations have been reported and 7 deaths.
- The ILI consultation rate was 0.0 consultations per 1,000 patients visits in week 12. The ILI rate was below the expected levels for this time of year.
- One influenza outbreak in another setting has been reported in week 12. So far this season, 11 influenza outbreaks have been reported in a nursing home, 1 outbreak has been reported in a hospital, 6 influenza outbreaks were reported in other settings and 72 ILI outbreaks were reported in schools.

Canada:

- Influenza activity continues to be reported in all regions in Canada; however, all indicators of influenza activity decreased compared to the previous week
- A sharp decrease was observed in laboratory detections of influenza, as well as hospitalizations due to influenza in both the adult and pediatric populations.
- Laboratory detections and syndromic indicators may be influenced by the COVID-19 pandemic. These data should be interpreted with caution.
- In week 12, two thirds of influenza detections were influenza A, and among those subtyped, A(H1N1) continues to be the dominant subtype circulating in Canada.
- The highest cumulative hospitalization rates are among children under 5 years of age and adults 65 years of age and older. Hospitalizations among adults are predominantly due to influenza A, while those among children are due to a mix of influenza A and B.

International:

Seasonal influenza:

In the temperate zone of the northern hemisphere, influenza activity appeared to decrease overall. In North America, influenza activity continued to decline but influenza-like illness (ILI) levels remained elevated. In Europe, influenza activity decreased in most countries, but increased ILI activity was reported in some countries. In Central Asia, influenza activity was low. In Northern Africa, decreasing influenza activity was reported inTunisia. In Western Asia, influenza activity was low in most reporting countries. In East Asia, influenza-like illness (ILI) and influenza activity returned to baseline levels. In the Caribbean and Central American countries, influenza activity was reported in some countries. In Mexico, influenza activity continued to decrease, with influenza A(H1N1)pdm09 and B-Victoria lineage viruses co-circulating. In tropical South American countries, influenza activity decreased from the previous reporting period. In tropical Africa, influenza detections were low in most reporting countries. In Southern Asia, increased influenza activity was reported in Bhutan. In South East Asia, influenza activity decreased across reporting countries. In the temperate zones of the southern hemisphere, influenza activity remained at inter-seasonal levels. Worldwide, seasonal influenza A viruses accounted for the majority of detections.

Effectiveness of 2019-2020 influenza vaccine:

Based on a recently published <u>Canadian Vaccine Effectiveness Study</u>, mid-season vaccine effectiveness (VE) estimates indicate that this year's vaccine is approximately 58% (95%CI: 47 to 66%) effective against the circulating strains (H1N1pdm09, H3 and B). A VE of 58% means that 6 cases out of 10 would have been prevented if they received the vaccination. This is still a substantial protection against medically-attended influenza illness in the early part of the season, especially for children, despite the fact that a considerable proportion of the circulating strains were genetically mismatched to the vaccine strains.

Emerging Respiratory Viruses:

• <u>COVID-19</u>: On December 31, 2019, a cluster of cases of pneumonia was reported in Wuhan, China, and the cause has been confirmed as a new coronavirus that has not previously been identified in humans (COVID-19). As of April 6, 2020, 15,822 cases of COVID-19 infection in Canada have been identified with 293 deaths. One-hundred and three cases have been identified in New Brunswick with no deaths. China has officially reported (as of April 6, 2020), 81,708 confirmed cases from 31 provinces with 3,331 deaths. As of April 6, the WHO reported globally 1 210 956 confirmed cases and 67 594 deaths in 201 countries/territories/areas.

Influenza Laboratory Data¹

- Influenza activity continued to decrease in week 12.
- 108 influenza cases were reported during week 12, 0 influenza A (H1N1)pdm09, 0 influenza A (H3), 70 influenza A (unsubtyped), 37 influenza B and 1 influenza A and B co-infection.
- Since the beginning of the season, 2324 influenza cases have been reported, 69 influenza A (H1N1)pdm09, 30 influenza A (H3), 846 influenza A (unsubtyped), 1366 influenza B and 13 influenza A and B co-infection.

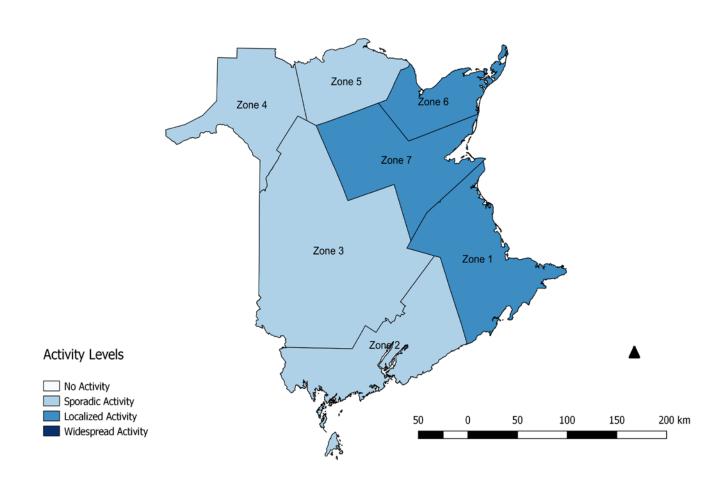

<u>Graph 1</u>: Number and percent of positive influenza specimens² in New Brunswick by week, up to March 21, 2020 (data source: G. Dumont Lab results)

¹ Surveillance specimens are submitted by recruited New Brunswick Sentinel Practitioner Influenza Network (NB SPIN) practitioners, which are comprised of sites in Emergency Rooms, in Family Practice, in First Nations communities, in Nursing Home, in Universities and in Community Health Centers. Diagnostic specimens are submitted by physicians in the community/hospital setting. Influenza laboratory data is comprised of results from surveillance and diagnostic specimens. All laboratory specimens are tested using a real-time PCR assay, which is a rapid detection method designed for detection of all known variants of influenza A and B. All laboratory-confirmed cases are reported for the week when laboratory confirmation was received.

² Total number of positive influenza tests is higher than number of cases since some individuals had co-infection of A & B simultaneously.

Figure 2: Influenza/ILI activity levels³ by Health Zones, in New Brunswick, for week 12, season 2019/2020.

³ No activity is defined as no laboratory-confirmed influenza detections in the reporting week, however, sporadically occurring ILI may be reported. Sporadic activity is defined as sporadically occurring ILI and lab confirmed influenza detection(s) with no outbreaks detected within the influenza surveillance region.

<u>Localized activity</u> is defined as evidence of increased ILI with lab confirmed influenza detection(s) and outbreaks in schools, hospitals, residential institutions and/or other types of facilities occurring in less than 50% of the influenza surveillance region.

<u>Widespread activity</u> is defined as evidence of increased ILI with lab confirmed influenza detection(s) and outbreaks in schools, hospitals, residential institutions and/or other types of facilities occurring in greater than or equal to 50% of the influenza surveillance region.

ILI Consultation Rates⁴

- For week 12, the ILI consultation rate was 0.0 consultations per 1,000 patients visits. The ILI rate was below the expected levels for this time of year.
- During week 12, the sentinel response rate was 21% for both the FluWatch sentinel physicians and the NB SPIN practitioners.

Graph 2: ILI Consultation Rates in New Brunswick, by report week, season 2019/20 compared to previous seasons*

^{*} The mean rate was based on data from the 1996/97 to 2018/2019 seasons and excludes the Pandemic season (2009/10).

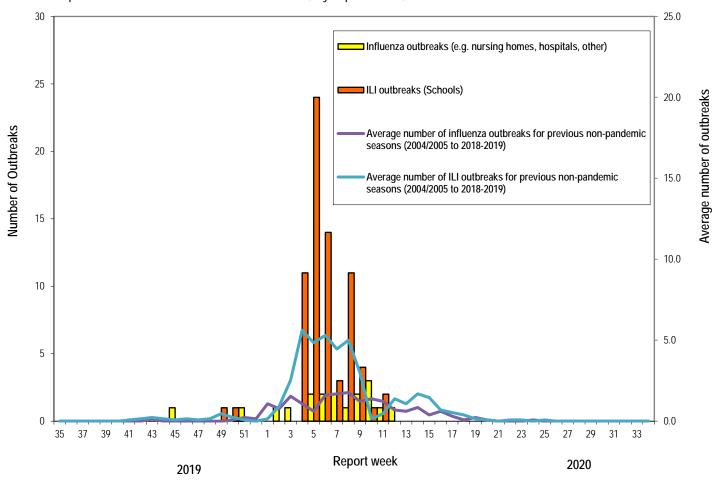

⁴ A total of 28 practitioner sites (16 FluWatch sentinel physicians and 12 NB SPIN sites) are recruited this season to report the number of ILI patients and total patient consultations one day during a reporting week.

3) ILI and Laboratory-Confirmed Outbreak Data

<u>Table 2</u>: ILI activity/outbreaks in New Brunswick nursing homes and schools for the reporting week, current and previous seasons.

	Marc	Reporting period: h/15/2019-March/21/20	Cumulative # of outbreaks	Cumulative # of outbreaks		
	Lab-confirmed outbreaks in Nursing homes ⁵	ILI school outbreaks ⁶	Lab-confirmed outbreaks in Other settings ⁴	season 2019-2020	season 2018-2019	
Zone 1	0 out of 13	0 out of 74	1	12	12	
Zone 2	0 out of 16	0 out of 81	0	15	13	
Zone 3	0 out of 14	0 out of 95	0	29	6	
Zone 4	0 out of 6	0 out of 22	0	10	0	
Zone 5	0 out of 2	0 out of 18	0	4	0	
Zone 6	0 out of 9	0 out of 35	0	8	4	
Zone 7	0 out of 4	0 out of 27	0	12	8	
Total NB	0 out of 64	0 out of 352	1	90	43	

<u>Graph 3</u>: Number of Influenza Outbreaks (nursing homes, hospitals, other) and ILI Outbreaks (schools) reported to Public Health in New Brunswick, by report week, season 2019/20.

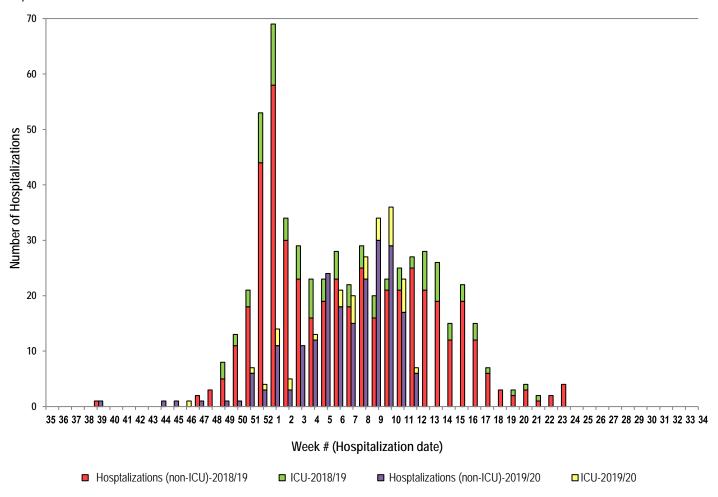

⁵ Two or more ILI cases within a seven day period, including at least one laboratory-confirmed case of influenza. Outbreaks are reported in the week when laboratory confirmation is received.

6

⁶ Schools reporting greater than 10% absenteeism which is likely due to ILI.

4) Influenza associated Hospitalization⁷ and Death⁸ Surveillance⁹

<u>Graph 4</u>: Influenza associated Hospitalizations and ICU admissions in New Brunswick, by week of hospitalization for current and past season.*

^{*}Those who had been hospitalized 15 days or more prior to laboratory confirmation date were excluded from the graph

Prepared by the Communicable Disease Control Unit, Office of the Chief Medical Officer of Health, Tel: (506) 444-3044

^{**}Seven deaths have been reported so far in season 2019-2020.

⁷ Hospitalizations (including ICU admissions) are influenza associated; they may or may not be due to influenza.

 $^{^{8}}$ Deaths are influenza associated; influenza may not be the direct cause of death.

⁹ In early January 2014, the Office of the Chief Medical Officer of Health implemented a new provincial surveillance system in collaboration with the Regional Health Authorities to monitor influenza-associated hospitalizations, intensive care unit admissions and deaths. A standardized Enhanced Surveillance Form is used to collect data on hospitalizations.
